

HT Hypalon 175 FLEX HOSE

HOSES > Chemical hoses

Flexible hose made of very resistant polyester fabric coated with seven layers of CSM POLYETHYLENE CHLOROSULFONATE rubber (Hypalon®). CSM derives from the chlorosulfonation of crystalline polyethylene made amorphous through the introduction of chlorine in quantities varying from 25% to 45%.

Different types of polymers are available characterized by a variable chlorine content. The physical-mechanical characteristics, compression behavior, chemical resistance and resistance to low temperatures are influenced by the chlorine content. The tube is reinforced by an external support spiral in hot-dip galvanized steel crimped to the fabric.

Extremely flexible - axial compressibility 1:4

Black colour, available on request with stainless steel spiral or with double layer of fabric.

MAXIMUM WORKING TEMPERATURE: -40° +170°

USE:

For the conveyance of chemically aggressive gases at high and low temperatures.

Resistant to oil mist, excellent resistance to UV ultraviolet rays, mineral, vegetable and animal fats, hydrocarbons and some types of freon. Good resistance to alkalis and acids.

Compliant with RoHS regulations.

PIPE AVAILABLE IN PIECES FOR USE or in standard lengths of 3 - 6 meters
